

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that allows the driver to work the lift truck without leaving the seat. They are made out of high quality materials and are designed to endure the most difficult procedures and work surroundings. Side shifting models have the extra ability to be able to laterally position the arms or the entire load in order to facilitate more exact carrying and position in a faster and much more effective manner.

The blade pocket is rather unique and could enable the one operating it to securely sway the blades into position without any worry of damaging the positioning cylinders. This can allow the operator the choice to be able to execute independent or simultaneous fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into fork positioners on existing units.
